EDUCATION

University of Illinois Urbana-Champaign — *Master of Computer Science (Artificial Intelligence)* Expected: December 2027

DePaul University — *Bachelor of Science in Computer Science* December 2024

TECHNICAL SKILLS

Languages: Python, Java, TypeScript, JavaScript, Go, Swift, C, C++

Frameworks & Tools: React.js, React Native, SwiftUI, UIKit, Node.js, FastAPI, Flask, .NET, Docker, Git

ML & AI: Computer Vision, LLMs, Generative AI, PyTorch, Hugging Face Transformers, Model Inference

Databases & Cloud: AWS, SQL, PostgreSQL, MariaDB, MySQL, Supabase, Firebase, GCP

EXPERIENCE

GoCe — *Full Stack & Computer Vision Engineer*

Chicago, IL

November 2025 – June 2026

- Built a panoramic image stitching pipeline using Hugin that transformed sequential mobile captures into high-resolution 360° environments, processing **200+ daily client requests** and enabling remote property navigation through an interactive viewer
- Integrated Gemini-powered vision models into the panorama pipeline to detect, localize, and measure objects within 360° environments, exposing inference results through REST APIs for downstream spatial search and visual inspection
- Built Python microservices that processed and indexed panoramic datasets into structured spatial metadata, reducing processing time by **60%** and enabling fast object retrieval across scanned environments

Zabihah — *Full Stack & Data Engineer*

Remote

May 2025 – August 2025

- Delivered personalized restaurant recommendations to **250K+ users** at sub-200ms response times by building a location-based discovery system using embedding-based geospatial queries, Core Location, and a REST API backend
- Built automated Python scripts that aggregated daily transaction data into structured business reports covering revenue totals, order volume, and sales trends, reducing manual reporting by **85%** and delivering insights to management daily
- Increased daily active users by **40%** by building a SwiftUI content feed with restaurant reviews, ratings, and comments, implementing optimized state management and lazy data fetching to keep the feed responsive across a high-traffic user base

Resonate — *Full Stack Software Engineer*

Remote

September 2024 – February 2025

- Increased user retention by **50%** across an initial cohort of **1,000 users** by launching a TypeScript-based learning platform with a generative AI recommendation layer using embedding similarity across the Google Books corpus via OpenAI APIs
- Cut recommender system latency by **40%** by decomposing a monolithic engine into Go microservices with RESTful APIs, enabling independent model inference deployment and CI/CD pipeline integration via GitHub Actions
- Improved recommendation relevance by **20%** and cut PR turnaround in half by implementing intelligent feature engineering and unit-tested AI-assisted filtering logic that reduced edge-case failures

Cars Commerce — *iOS Software Engineer Intern*

Chicago, IL

June 2024 – August 2024

- Cut CI/CD build times by **90%** for a team shipping features to **25M+ monthly users** by creating a reusable SwiftUI component library that eliminated redundant compilation, accelerating iteration speed across the iOS engineering org
- Shipped **15+** production-ready SwiftUI components across the Cars.com app and reduced rework cycles by building an internal component sandbox that let engineers and designers preview UI interactions in real time, enabling instant validation without a full build

Engageathon — *Backend Software Engineer Intern*

Remote

November 2023 – April 2024

- Achieved **zero downtime** across 3 NFL Alumni Super Bowl live events engaging **3,000+ attendees** by deploying a scalable real-time posting board with redundant backend services and load-tested infrastructure
- Improved API performance by **30%** for **2,000 concurrent users** by adding a Node.js caching layer that reduced redundant database queries and smoothed response times under peak load

PROJECTS

DePaul University Cybersecurity Clinic — *Team Lead & Developer*

March 2024

- Secured a **\$100K grant** by leading a 6-member team to ship a full-stack web application enabling DePaul's Cybersecurity Clinic to deliver real-world client services built with role-based authentication and a normalized relational schema
